

## Websense® Data Security Suite

Protecting customer and other confidential data from malicious and accidental leaks is one of the top business and IT security challenges facing organisations today. Compounding this problem, CIOs and CSOs must protect their data amid pressure from regulatory and corporate compliance requirements, customer and competitive pressures and the rising cost and publicity of data leaks. Websense® Data Security Suite is the leading solution for preventing data loss—external and internal, accidental and malicious.

Websense Data Security Suite discovers where data is located in a network, monitors who is using the data and how they are using it, and helps protect the data—securing business processes, managing risk and assisting with compliance.

“With Websense Data Security Suite, we’re able to monitor and filter all inbound and outbound network traffic, ensuring that our company, our members and our information are protected.”

**Glen Chrzas**

Vice President of Technology  
Altura Credit Union

### How it works

Websense Hosted Web Security acts as a Web proxy hosted off your network. You can enable the proxy through a chained connection to your existing proxies, or by automatically directing users’ browsers to the Websense service. Websense datacenters are load-balanced, redundant, highly available clusters

located in eleven locations worldwide. All Websense datacenters have been certified to ISO27001 standards to provide the highest degree of global and localised security, privacy and confidentiality. Websense SLAs guarantee uptime and provide competitive spooling and disaster recovery provisions as standard elements of the service.

Websense Data Security Suite is the only data loss prevention (DLP) solution that provides content, context and destination awareness, allowing administrators to manage who can send what information, where and how. Using agent-less discovery tools and patent pending PreciseID™ fingerprinting technology, Websense Data Security Suite automatically discovers hosts inside the network—including servers and endpoints—and the data stored on them, and allows administrators to create and implement content enforcement policies. Websense Data Security Suite goes beyond simple keyword and pattern matching solutions; it provides Deep Content Control™ to discover, monitor and protect confidential information, including personally identifiable information (Pii), regulatory data and intellectual property (iP), regardless of the file type or format.

### Discover

Websense Data Security Suite discovers data stored throughout the network: in data repositories, file shares and whether on servers or endpoints. Armed with the knowledge of where data is, organisations can identify broken business processes, create efficient workflows and establish policies to protect confidential data.

PreciseID, included with Websense Data Security Suite, is a third-generation data fingerprinting technology that goes far beyond simple keyword, pattern matching and regular expression engines. PreciseID fingerprints both structured and unstructured data regardless of file type or format. Websense Data Security Suite creates multiple fingerprints per file via a one-way mathematical representation, analysing the content within the document so that it can monitor and protect the data no matter how it has been manipulated.

Websense Data Security Suite is the leading solution for preventing data loss—external and internal, accidental and malicious.

## Summary

The Internet is an invaluable business tool, however unmanaged access can have undesirable consequences, including unproductive employee work habits, unnecessary bandwidth consumption, and inadvertent or malicious infection of desktops.

## Protect

Websense Data Security Suite is the only solution with native enforcement for in-line protection of SMTP and HTTP traffic. It provides the tools to protect data in line with existing business processes. Policies can be set to enforce data security controls automatically. This means that Websense Data Security Suite can automatically request encryption from data users; require that information owners authorise the use of their data; or require the IT manager to review requests. Using Websense Deep Content Control technology, administrators achieve greater enforcement accuracy, spend less time evaluating false positives and negatives, and gain more granular policy management capabilities. They are able to administer controls by user, content, destination and communication channel to enforce regulatory and corporate governance policies.

Websense has the only DLP solution that provides decision-ready destination awareness and control. Websense Data Security Suite integrates with Web intelligence solutions to set policies for the content destination. For example, an administrator can block all communication of confidential information to a spyware site, chat board and/or Web mail site with a single click of a pre-defined category, but still allow users to access the same site for legitimate purposes. The administrator can also create custom black lists, white lists and designate destination policies by specific users and/or information. Websense Data Security Suite gives organisations a proactive data protection solution with easy-to-use, flexible configuration options that align data security needs with relevant business requirements.
